Assalam o Alaikum,

IMPORTANT: MID LAB ASSESSMENT INSTRUCTIONS

All students must carefully read and strictly follow the instructions below for their Mid Lab Assessment.

01 PROJECT COMPLETION REQUIREMENTS

Each group must fulfill **at least ONE** of the two options below.

OPTION 1 | 100% FRONTEND

Complete the entire planned Frontend (FE).

- All approved screens, UI components, and navigation flows are implemented and functional.
- All user interactions, input validation, and visible states work.
- Backend implementation is not required for this option.

OPTION 2 | 50% FULL-STACK

Complete at least 50% of the project as working, integrated features.

- Completed scope must include both Frontend and Backend.
- Frontend and Backend must communicate and work together.
- Disconnected screens or standalone APIs do not count.

IMPORTANT DISTINCTION

Completing only 50% of the frontend does NOT satisfy either option.

How completion percentages will be measured

Assessment is based on the **approved project scope and demonstrable functionality**, not lines of code, time spent, or the number of files.

- **For Option 1:** 100% means every frontend screen and planned UI workflow is present, connected, and working. Backend work is excluded from this requirement.
- **For Option 2:** only fully working, integrated FE + BE features contribute toward the 50% threshold; frontend-only screens or standalone backend APIs do not count as completed full-stack features.
- **Calculation:** Completion (%) = (sum of accepted feature weights / sum of all approved feature weights) × 100. Features have equal weight unless different weights were approved in advance.
- **Evidence:** groups should present their agreed feature checklist and demonstrate each feature claimed as complete.

02 GITHUB REPOSITORY & GROUP CONTRIBUTIONS

- Each group must maintain **ONE shared GitHub repository**.
- **EVERY group member** must contribute to that same repository using their own GitHub account.
- Separate individual repositories are **NOT acceptable**.
- All code must be committed, pushed, and synchronized **before** the assessment.
- The repository must contain the latest working version of the project.
- **Commit history and individual contributions may be examined.**
- Being listed as a collaborator without actual code contributions is **not sufficient**.

03 LAPTOP & APPLICATION DEMONSTRATION

- **EVERY student must bring a laptop.**
- If you do not own one, **arrange a laptop for yourself before the assessment**.
- Your application must be properly configured, ready to launch, and functional.

Only the following demonstrations are permitted:

✓ A physical Android device.
✓ An Android emulator.

ZERO-MARKS RULE

Web browser demonstrations = ZERO MARKS. The Android application must run on an Android device or emulator.

04 IPHONE USERS

- Students using iPhones must arrange an Android device or a working Android emulator.
- Having an iPhone will **NOT** be accepted as an excuse.

05 SOFTWARE & SYSTEM REQUIREMENTS

Complete all setup and troubleshooting **before** examination day.

✓ Windows is installed and working properly.
✓ Android Studio is installed and configured.
✓ Android SDK, emulator, and required development tools are installed.
✓ The project builds and runs without errors.
✓ All dependencies and required services are functional.
✓ All technical and configuration issues have been resolved.

06 EVALUATION: IN-DEPTH VIVA & LIVE CODING

NOT JUST A PROJECT DEMONSTRATION

Every student must have complete knowledge of the entire project.

- Understand **every screen, component, function, class, and implemented feature**.
- Be able to explain the code, logic, navigation, architecture, and backend integration (where applicable).
- The examiner may question you about **ANY** part of the project, regardless of who developed it.

These excuses will NOT be accepted:

- "This is not my screen."
- "My group member developed this."
- "I did not work on this part."
- "I only worked on the frontend/backend."

Every group member is responsible for understanding the COMPLETE project.

LIVE CODING EVALUATION

- Existing code **may be deleted** and you may be asked to rewrite it.
- You may be asked to recreate an entire screen or part of a screen from scratch.
- You may be required to modify functionality, fix errors, or explain specific implementations.
- You must demonstrate the ability to write and understand code **independently**.

07 STRICT AI & AUTOCOMPLETION POLICY

PROHIBITED DURING THE EXAMINATION

NO LLMs or AI coding assistants are allowed. This includes ChatGPT, GitHub Copilot, Gemini, Claude, and any other AI-based coding assistant.

- All AI plugins, automatic code suggestions, and AI-based autocomplete features **MUST be disabled** before evaluation.
- Copilot-style inline suggestions and automatic code generation are strictly prohibited.

THE ONLY ALLOWED COMPLETION

Android Studio's built-in basic code completion, manually invoked with Ctrl + Space. No other automated completion or AI-assisted coding tools are permitted.

08 EXAMINATION TIMING & LAB DISCIPLINE

EXAMINATION CONDITIONS

This is a formal examination, not a regular lab session.

- **LATE ARRIVALS WILL NOT BE ALLOWED TO ENTER OR PARTICIPATE.**
- Arrive on time with a fully prepared laptop and a working project.
- After evaluation begins, **NO STUDENT MAY LEAVE THE LAB** without the examiner's permission.
- You may not leave to arrange a laptop, charger, Android device, or other equipment.
- Installation, configuration, and troubleshooting must be completed **BEFORE** the examination.

09 FINAL INSTRUCTIONS: STUDENT CHECKLIST

Before coming to the assessment, confirm every item below:

- ✓ Your group completed one of the **two required project options**.
- ✓ All group members contributed to the **same GitHub repository**.
- ✓ You have your own laptop or an arranged laptop.
- ✓ Your Android app works on a **physical Android device or emulator**.
- ✓ Android Studio and all required tools are fully configured.
- ✓ You understand **every part** of the project, including other members' work.
- ✓ All AI tools and prohibited autocomplete features are disabled.
- ✓ You can independently explain, modify, debug, and rewrite code.
- ✓ You will arrive **ON TIME** and remain in the lab for the examination.

NO EXCUSES WILL BE ACCEPTED

Incomplete work, missing laptops, technical issues, inadequate individual contributions, or lack of project understanding will not be accepted as excuses.

FINAL WARNING

A working project alone is NOT enough. Individual understanding, coding skills, GitHub contributions, and the ability to independently implement project functionality will be evaluated.

These instructions are MANDATORY for EVERY student. No exceptions will be entertained.
